

Inverse Matrix: an easy tool to test interactions in a trophic network

Application to the Gironde Estuary (France)

Sébastien Rochette, Jérémy Lobry,
Mario Lepage & Philippe Boët

Cemagref-Bordeaux, France

Outline

- Trophic food webs modelling
 - To approach the functioning of ecosystems
 - To calculate trophodynamic indicators
 - To compare different ecosystems

Outline

- Trophic food webs modelling
 - To approach the functioning of ecosystems
 - To calculate trophodynamic indicators
 - To compare different ecosystems

- How to make forecasts ?
 - Under compartment or human pressure modifications

Outline

- Trophic food webs modelling
 - To approach the functioning of ecosystems
 - To calculate trophodynamic indicators
 - To compare different ecosystems

- How to make forecasts ?
 - Under compartment or human pressure modifications

- How to cope when precise detailed data are unavailable?

Outline

- Trophic food webs modelling
 - To approach the functioning of ecosystems
 - To calculate trophodynamic indicators
 - To compare different ecosystems

- How to make forecasts ?
 - Under compartment or human pressure modifications

- How to cope when precise detailed data are unavailable?

- Qualitative approaches are attractive (Levins loop analysis)
 - Direct and indirect interactions taken into account
 - Not only biological compartments (e.g. fishermen or power plant)
 - Easy to use

Outline

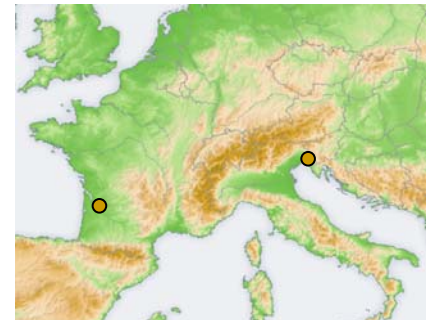

- Trophic food webs modelling
 - To approach the functioning of ecosystems
 - To calculate trophodynamic indicators
 - To compare different ecosystems

- How to make forecasts ?
 - Under compartment or human pressure modifications

- How to cope when precise detailed data are unavailable?

- Qualitative approaches are attractive (Levins loop analysis)
 - Direct and indirect interactions taken into account
 - Not only biological compartments (e.g. fishermen or power plant)
 - Easy to use

- A test on the Gironde case
 - A comparison with an existing Ecopath model
(*Lobry et al. 2004*)

Plan

- Reasons for the implementation
- Using a sensitivity analysis to perform Community matrix inversion
- Interpretation of the results and similarities with Ecopath

Using a known trophic network: The Gironde estuary food web

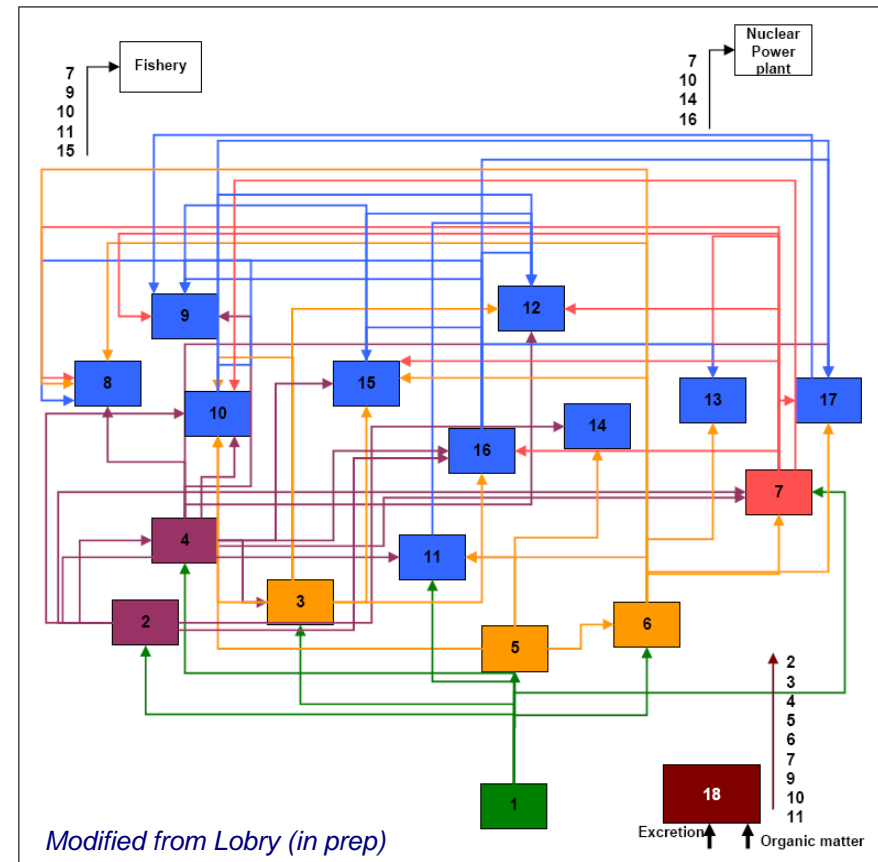

1.	Primary producers	11.	Mulets
2.	Copepods	12.	Big marine fish
3.	Suprabenthos	13.	Big pelagic fish
4.	Mysids	14.	Pipe fish
5.	Meiobenthos	15.	Flat fish
6.	Macrobenthos	16.	Gobids
7.	Shrimps	17.	Freshwater fish
8.	Sturgeons	18.	Detritus
9.	Eels	19.	Fishery
10.	Small pelagic fish	20.	Nuclear power plant

Using a known trophic network: The Gironde estuary food web

- Many trophic interaction links, strong and weak ones

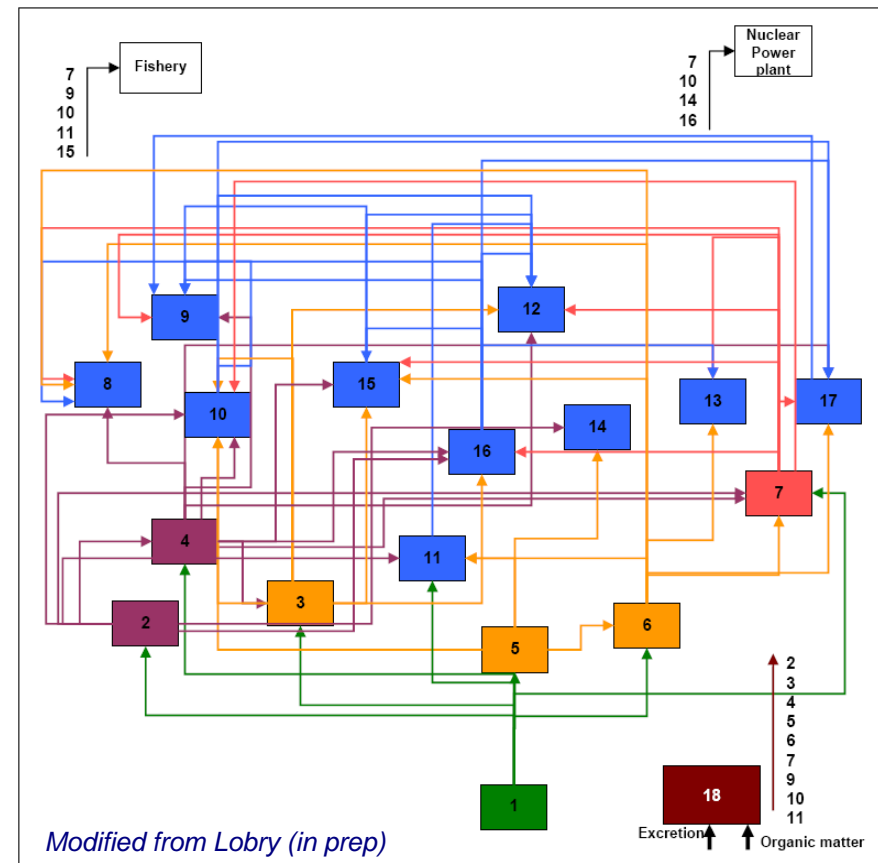

1.	Primary producers	11.	Mulets
2.	Copepods	12.	Big marine fish
3.	Suprabenthos	13.	Big pelagic fish
4.	Mysids	14.	Pipe fish
5.	Meiobenthos	15.	Flat fish
6.	Macrobenthos	16.	Gobids
7.	Shrimps	17.	Freshwater fish
8.	Sturgeons	18.	Detritus
9.	Eels	19.	Fishery
10.	Small pelagic fish	20.	Nuclear power plant

Using a known trophic network: The Gironde estuary food web

- Many trophic interaction links, strong and weak ones
- Ecopath model considered as a reference for our inverse matrixes study

1. Primary producers	11. Mulets
2. Copepods	12. Big marine fish
3. Suprabenthos	13. Big pelagic fish
4. Mysids	14. Pipe fish
5. Meiobenthos	15. Flat fish
6. Macrobenthos	16. Gobids
7. Shrimps	17. Freshwater fish
8. Sturgeons	18. Detritus
9. Eels	19. Fishery
10. Small pelagic fish	20. Nuclear power plant

Loop Analysis

- First step: construction of the “Community matrix”

1. Primary producers	11. Mulets
2. Copepods	12. Big marine fish
3. Suprabenthos	13. Big pelagic fish
4. Mysids	14. Pipe fish
5. Meiobenthos	15. Flat fish
6. Macrobenthos	16. Gobids
7. Shrimps	17. Freshwater fish
8. Sturgeons	18. Detritus
9. Eels	19. Fishery
10. Small pelagic fish	20. Nuclear power plant

- Effects of one component (columns) on the others (row). After inversion. Sum of direct and indirect interactions
 - Colour indicates: confidence > 90%
 - Green PP: positive effect
 - Red NNN, NN: strong or medium negative effect

Inverse matrixes and sensitivity analysis

- Method:
 - Distinct data by classes
 - Evaluate uncertainty on the results

19	NN	NN						-	-	NNN	-							NN	NNN	+
20	NN	NN	NN	-	+				-	-	NN				NN			+		NNN

- Effects of one component (columns) on the others (row). After inversion. Sum of direct and indirect interactions
 - Colour indicates: confidence > 90%
 - Green PPP, PP: strong or medium positive effect
 - Red NNN, NN: strong or medium negative effect

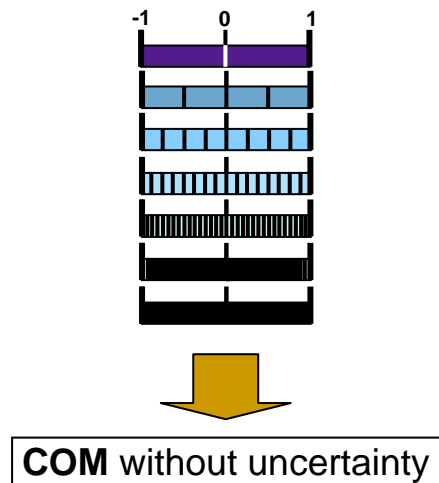

Inverse matrixes: results and interpretation

- | | |
|------------------------|-------------------------|
| 1. Primary producers | 11. Mulets |
| 2. Copepods | 12. Big marine fish |
| 3. Suprabenthos | 13. Big pelagic fish |
| 4. Mysids | 14. Pipe fish |
| 5. Meiobenthos | 15. Flat fish |
| 6. Macrobenthos | 16. Gobids |
| 7. Shrimps | 17. Freshwater fish |
| 8. Sturgeons | 18. Detritus |
| 9. Eels | 19. Fishery |
| 10. Small pelagic fish | 20. Nuclear power plant |
- Green PPP, PP: strong or medium positive effect
 ➤ Red NNN, NN: strong or medium negative effect

Correlation with « Mixed Trophic Impact »

- Increasing number of classes tends towards a Community matrix, free of uncertainty (COM)

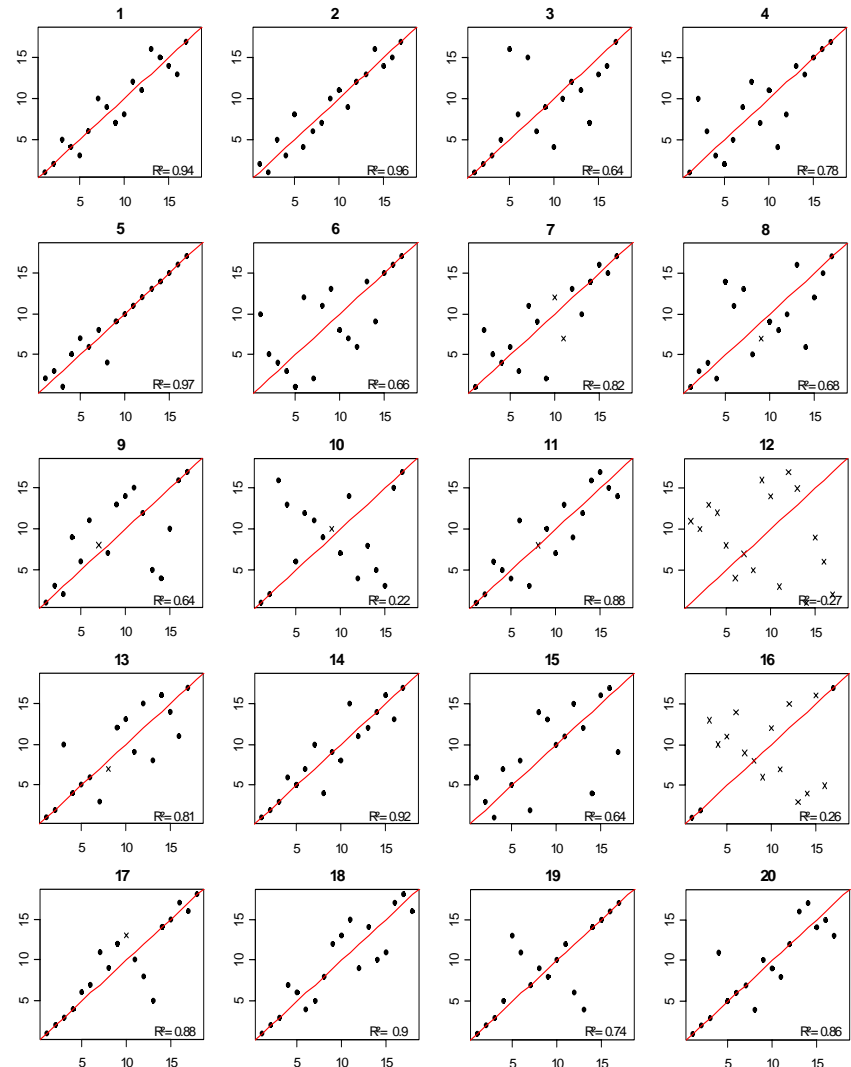

Correlation with « Mixed Trophic Impact »

- Increasing number of classes tends towards a Community matrix, free of uncertainty (COM)
- COM correlated with the “Mixed Trophic Impact” matrix

COM without uncertainty

Mixed Trophic Impact

Conclusions and perspectives

- A simple way
 - to assess indirect interactions
 - to identify influent or sensitive components

Conclusions and perspectives

- A simple way
 - to assess indirect interactions
 - to identify influent or sensitive components

- An intermediate approach between loop analysis & Ecopath (“Mixed Trophic Impact”)

Conclusions and perspectives

- A simple way
 - to assess indirect interactions
 - to identify influent or sensitive components

- An intermediate approach between loop analysis & Ecopath (“Mixed Trophic Impact”)

- Offering
 - simulation possibilities with confidence percentages
 - comparison means of several ecosystems, poorly-known as well
 - Possible improvement of MTI in order to add confidence intervals on results

Thanks for your attention.
